Submitted (AuG-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: RECEPTOR FOR EXTRACELLULAR ADENINE NUCLEOTIDES SUCH AS
ATP AND ADP. IN PANCREATIC ISLETS, MAY MEDIATE SOME OF THE EFFECTS
OF EXTRACELLULAR ATP ON INSULIN SECRETION.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

"Molecular basis for ADP-induced platelet activation. II. The P2Y1
receptor mediates ADP-induced intracellular calcium mobilization and
shape change in platelets.";
J. Biol. Chem. 273:2030-2034(1998).
I. FUNCTION: RECEPTOR FOR EXTRACELLULAR ADENINE NUCLEOTIDES SUCH AS
ATP AND ADP. IN PLATELETS BINDING TO ADP LEADS TO MOBILIZATION OF
INTRACELULAR CALCIUM IONS VIA ACTIVATION OF PHOSPHOLIPASE C, A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- INDUCTION: REPRESSED BY THE P2Y1 RECEPTOR-SPECIFIC AWTAGONISTS
A3P5PS, A3P5P AND A2P5P. THESE INHIBIT CALCIUM ION MOBILIZATION
AND SHAPE CHANGE IN PLATELETS.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ayyanathan K., Tania W., Harbansjit S., Raghbir A.S., Barnard E.A.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CHANGE IN PLATELET SHAPE, AND PROBABLY TO PLATELET AGGREGATION.

Biophys. Res. Commun. 236,455-460(1997).
FUNCTION: RECEPTOR FOR EXTRACELLULAR ADENINE NUCLECTIDES SUCH AS ATP AND ADP. SEEMS TO MEDIATE ITS ACTION VIA A PERTUSSIS TOXIN INSENSITIVE G-PROTEIN. PROBABLY BELONGING TO THE GO FAMILY THAT ACTIVATE A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM. SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: MAINLY FOUND IN BLOOD, BRAIN, AND LUNG. TO A LESSER EXTENT IN STOWAGH, GUT, AND SKELETAL MUSCLE.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-FEB-1996 (Rel. 33, Created)

"Early expression of a novel nucleotide receptor in the neural plate
                                                                                                                                  of Xenopus embryos.";
J. Biol. Chem. 272:12583-12590(1997).
-!- FUNCTION: RECEPTOR FOR EXTRACELLULAR ATP, UTP, CTP, GTP AND ITP.
                                                                                                                                                                  THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE A PHOSPHATIDYLINOSITOL-CALCION SECOND MESSENGER SYSTEM, MAY PLAY A KEY ROLE IN THE EARLY DEVELOPMENT OF NEURAL TISSUE.

1. SUBCELLULAR LOCATION: Integral membrane protein.

1. SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

"A novel G protein-coupled P2 purinoceptor (P2Y3) activated
preferentially by nucleoside diphosphates.";
Mol. Pharmacol. 50:258-265(1996).
-!- FUNCTION: RECEPTOR FOR EXTRACELLULAR ADP > UTP > ATP = UDP. THE
ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE
A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

J. Neurochem. 71:1424-1434(1998).

-i- FUNCTION: Receptor for ATP and UTP coupled to G-proteins that activate a phosphatidylinositol-calcium second messenger system.

Not activated Dy ADP or UDP.

-i- SUBCELLULAR LOCATION: Integral membrane protein.

-i- TISSUE SPECIFICITY: Widely expressed at low levels. In brain, higher expression in the pineal gland and ventricular system.

-i- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BY SIMILARITY.

Rapid progression to AIDS in HIV+ individuals with a structural
variant of the chemokine receptor CX3CR1.";
Science 287:2274-2277(2000).
--- FUNCTION: RECEPTOR FOR THE CX3C CHEMOKINE FRACTALKINE AND MEDIATES
BOTH ITS ADHESIVE AND MIGRATORY FUNCTIONS. ACTS AS CO-RECEPTOR
WITH CD4 FOR HIV-1 VIRUS ENVELODE PROPEIN (IN VITRO).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CHARACTERIZATION.

TISSUE SPECIFICITY: EXPRESSED IN LYMPHOID AND NEURAL TISSUES.
DISEABE: INCREASED SUSCEPTIBILITY TO HIV INFECTION AND RADID
PROGRESSION TO AIDS ARE ASSOCIATED WITH THE 1-249/M-280 HAPLOTYPE.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
